Education

PG Diploma in Advanced Computing (PG-DAC)

Grade: A

Sunbeam Institute of Information Technology, Pune

Bachelor of Engineering – Information Technology

CGPA: 8.60

Smt.Kashibai Navale College of Engineering, Pune

SSC (X)

Percentage: 91.20%

Rajeev Gandhi Military School, Buldhana

Technical Skills

Programming Languages: Java, SQL, JavaScript

Frontend Technologies: React.js, HTML5, CSS3, Tailwind CSS, Bootstrap

Backend Technologies: Spring Boot, Spring MVC, RESTful APIs

Databases & ORM: MySQL, JPA, Hibernate

Tools & IDEs: Eclipse, IntelliJ IDEA, VS Code, Postman

Version Control & Collaboration: Git, GitHub

Projects

RentARide – Car Rental Management System (Monolithic Full-Stack Application)

React.js — Spring Boot — MySQL — Spring Security — Razorpay — Cloudinary

- Developed a full-stack monolithic web application to manage car rentals, including user registration, vehicle browsing, booking management, and secure payments.
- Built a responsive single-page frontend using React.js with reusable components, efficient state management using hooks and props, and smooth navigation via React Router.
- Implemented a layered backend architecture (Controller–Service–Repository) using Spring Boot and exposed RESTful APIs for CRUD operations.
- Applied SOLID principles and clean code practices to ensure maintainability and scalability.
- Implemented global exception handling using `@RestControllerAdvice` and input validation using `@Valid` for meaningful error handling.

TurfNation – Turf Management System (Microservices Architecture)

React.js — Spring Boot — Microservices — MySQL — Kafka — Redis — Eureka — API Gateway — Config Server

- Designed and developed a microservices-based turf management system to handle user authentication, turf booking, payments, notifications, reviews, and support services.
- Implemented service discovery using Eureka Server, centralized configuration using Config Server, and request routing through API Gateway.
- Secured microservices using Spring Security with JWT-based authentication and role-based access control.
- Built a Kafka-based notification service to handle asynchronous events such as user registration and booking confirmations.
- Used Redis to temporarily store OTP values during user registration and sent verification emails using Spring's `JavaMailSender`.
- Sent automated email notifications for successful registrations and booking confirmations with complete booking details.
- Used MySQL with JPA and Hibernate for data persistence, ensuring transactional integrity within individual services.
- Followed SOLID principles, centralized exception handling, and validation to build a robust and maintainable system.
